PROJECT NAME	AI POWERED VIDEO SCRIPT GENERATOR
MAXIMUM MARKS	

Solution Requirements – AI Powered Video Script Generator

The goal of this project is to build a simple AI-based tool that helps users quickly create high-quality video scripts without spending too much time on writing.

Many content creators, students, marketers, and social media users struggle with writing engaging scripts. They often spend hours thinking about ideas, structuring content, and adjusting tone for different platforms like YouTube, Instagram, or ads. This tool solves that problem by automating the script-writing process using AI.

1. User Input Requirements

The system will take basic inputs from the user such as:

- Topic or idea of the video
- Target audience (e.g., students, professionals, general public)
- Platform (YouTube, Instagram Reels, ads, etc.)
- Tone of the script (formal, casual, motivational, funny, etc.)
- Duration or length of video (short, medium, long)

These inputs help the AI understand exactly what kind of script is needed.

2. System Requirements

The system will include:

- A simple web interface (built using Flask)
- Backend integration with an AI model (like GPT/Groq/Claude)
- A prompt processing system that combines all user inputs into a structured instruction for the AI
- Output display section where the generated script is shown clearly

3. AI Processing Requirements

The AI model will:

- Understand user inputs in natural language
 - Generate structured video scripts (intro, main content, conclusion)
 - Adjust tone and style based on platform and audience
 - Keep content engaging, clear, and relevant to the topic
-

4. Output Requirements

The output script should:

- Be properly structured (Hook → Body → Conclusion)
 - Match the selected tone and platform style
 - Be ready to use for video recording or editing
 - Be easy to copy or download
-

5. Non-Functional Requirements

- The system should respond quickly (low latency)
 - Interface should be simple and beginner-friendly
 - It should work on basic devices using a browser
 - The design should be clean and distraction-free
-

6. Future Improvement Scope

Later versions can include:

- Multiple script variations for the same input
- Voiceover generation
- Auto video creation from script
- Trending topic suggestions
- Multi-language script generation
